Q.1 Multiple choice question.

1. Study of algae is called

a) Mycology

b) Protozoology

c) Phycology

d) Virology

2. Who is isolate the bacteria that causes anthrax, tuberculosis, cholera.

a) Louis Pasteur

b) Joseph Lister

c) Alexander Fleming

d) Robert Koch

3. The cells are cylindrical or rod shape they describe as

a) Cocci

b) Bacteria

c) Bacilli

d) Fungi

4. The sum total of process by which the living organism receive the material necessary for survival, growth & repair of worn out part called

a) Nutrient

b) Nutrition

c) Nutrigenomics

d) Nutrigenetics

5. Peptidoglycan is also called

a) Murein

b) Mucopeptides

c) Glycopeptides

d) Glycosides

Q.2 Write a short note.

1) Short note on important contribution of various scientist - Louis Pasteur.

→ i) In 1856-57 Louis Pasteur solved the problem of wine and beer industry.

ii) In France wine & beer industry were facing problem of sour wine.

iii) He studied the methods and process involved in wine and beer manufacturing.

iv) He found that fermentation of fruits and grains result in alcohol was brought by microbes.

v) The undesirable microbes can be removed by heating fruit juice. This process is called as pasteurization.

↑ Add Points

2) Short note on cytology of Bacteria.

→ i) Cytology means study of internal structures and the functions of bacterial cell.

ii) Bacterial cell shows various anatomical parts, some of these are external to rigid cell wall.

iii) While others are internal to cell wall.

iv) The external parts include capsule, flagella and pili while internal parts include cell membrane, cytoplasm, nuclear region, ribosomes and vacuoles.

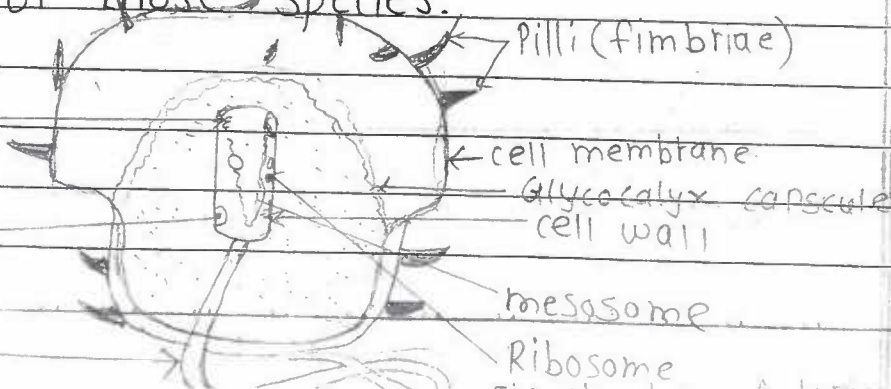

Some structures are common for all species while some are present in few species which are characteristics of those species.

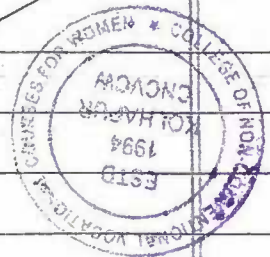

Chromatic body

Granule

Flagellum

Ribosome

4) Write short note on shape of Bacteria.
 specific shape of bacteria is due to the presence of rigid cell wall. Bacteria exhibits three shapes as follows:

- This are intracellular parasites.
- The size of viruses ranges from 20nm to 300 nm.
- This are very small, ultramicroscopic & required Electron microscope for study.

3) Viruses - • viruses are neither prokaryotic nor eukaryotic in nature.
 • Some algae are used as biofertilizers.
 • They are used as good source of single cell protein (SCP).

2) Algae - • Algae are eukaryotic in nature.
 • Algae has wide range of shape & are mainly aquatic in nature.

1) Fungi - • Fungi are Eukaryotic non-photosynthetic microorganisms.
 • The cell wall fungi contains chitin or cellulose of both.
 • The fungi are divided in two types -
 i) Yeast = produce Pseudomycelium & reproduce by binary fission.
 ii) Mould = produce true mycelium & reproduce by sexual & asexual reproduction.

3) Classification of Micro-organisms. (Any two)
 Micro-organisms are too small to be seen by naked eye.

- a) Spherical / Ellipsoidal - If the cells are spherical / Ellipsoidal or ball shape, they are described as cocci. Cocci may be perfect spheres but can also exist in oval or bean shape.
- b) cylindrical / Rod shaped - If the cells are cylindrical / rod shaped they are described as bacilli. Some are short, hence called as coccobacilli.
- c) Spiral / Helical Shape - some bacteria are curved or Helical shape cylindrical. A part from this three shapes the some modifications in the shapes are observed like -
- 03
- i) curved rod / comma shaped bacteria -
e.g. *Vibrio cholerae*
 - ii) Pear shaped -
e.g. *Pasteuria*
 - iii) Rods with square ends -
e.g. *Bacillus anthracis*

Q.3 Write a Long Answers.

1) Explain Gram negative Bacteria with diagram.

→ i) Cell wall of gram negative bacteria is more complex than the cell wall of gram positive bacteria.

ii) It is bilayered and thinner than the cell wall of gram positive bacteria.

iii) It is made up of 2 layers :-

A) Inner peptidoglycan layer - It is located in between cell membrane & outer wall layer.

- peptidoglycan content is low which accounts for 5-10% of cell wall.

- All N-acetyl mutamic acid molecules are not linked to tetrapeptide side chains.

- The third amino acid of tetrapeptide side chain is mesodiaminopimilic acid instead of L-lysine.

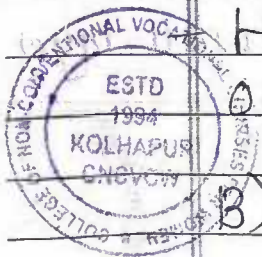

- Crossbridges are simply peptide bonds formed between 4th amino acids of one side chain and 3rd amino acid 2nd side chain.

- Thus during crossbridge formation, some side chains remain free and network becomes less rigid.

- The peptidoglycan layer itself is insufficient to give rigidity and protection.

Hence extra protection is given by an outer wall layer.

B) Outer peptidoglycan or wall layer :- It surrounds peptidoglycan layers & width is 7 to 8 nanometre.

-replition

- Chemically it is made up of :-

- Phospholipids
- lipopolysaccharids
- proteins
- lipoproteins

A) Phospholipids - It is present in outer wall are similar to those all the same membrane having knob like structure with 2 parts -

- i) Polar hydrophilic head
- ii) Non-polar hydrophobic tail

B) Lipopolysaccharides -

- It is second measure compound of outer wall layer of gram negative bacteria cell wall.

- It is located only at the outer side.

C) Proteins -

- Proteins of outer wall layer are structural proteins and embedded in bilayer.

- Here proteins are called porins and they serve as membrane channels for the entry and exit of low molecular substance like sugars, amino acids, etc.

D) Lipoproteins :

- These are present in the inner side of outer wall layer.

- It works as a connecting bridge between the peptidoglycane layer and outer wall layer
